

Snakeweed/Galleta Grassland (13)

Location. This map class occurs primarily in the Wupatki Basin in the vicinity of the employee housing area, although a few polygons occur to the north on the Babbitt Ranches.

Photosignature. The streaky black-and-orange signature of this map class is very similar to some polygons of Moenkopi Sandstone Sparse Vegetation (5), because the substrate is a similar mix of silt, sandstone fragments and black cinder. For the most part, this map class was mapped in the field.
